

THE INNOVATORS

Zero Nickel Zero Palladium **Soft White Golds-Alloy #00-14 & #00-18**

This is a new alloy type that contains no nickel or palladium whatsoever. This means that there will be no nickel related problems such as skin sensitivity, 1900+ degree casting temps, nickel silicate, or SO2 related porosity. The high expense and temperature of palladium is avoided completely. These white golds are very soft. So soft in fact that the casting gold can be rolled out very easily saving on gold costs. This will please stone setters and fabricators the world over. The "00" white gold is very easy to melt, the temperatures are similar to yellow gold, about 1850 F. #00-14 is used for both 14kt and 10kt white gold. Patent pending, of course.

"00-14 and "00-18" are easy to use, if the printed instructions are followed to the letter. Solders are available, and rolled wire stock or sheet can be special ordered. We can even cast your waxes in this new gold for you.

Additionally, a video is available for \$25 VHS or VCD. That plays on Windows Media on most computers or DVD players.

Tech support on our 800 line comes at no charge.

The alloy has been tested by hydrogen and natural gas torch casting and in casting machines that can use a hydrogen/nitrogen mix to protect the gold from the air, and in those "pressure over vacuum" enclosed casting machines. If you can protect the molten gold from oxygen you can use this great new gold.

The color is very good, comparable to most nickel based alloys and is superior to some. Rhodium is appropriate to prevent time tarnishing and to improve color.

The alloy price is about \$5.00 per ounce. Discounts available for orders above 500 ounces.

Karated gold is available. quote from price sheet but use 10% for net 30 and 8% for COD. Credit cards can be used only if we calculate a 15% over spot rate. Orders under \$250 will receive the written instructions only.
